

WHAT WILL I NOTICE?

- i) Removal of scale and stains in showers, baths and basins.
- ii) Softer smoother skin from softer water.
- iii) Better tasting, less smelly water (for really great tasting tap water fit a Little Plumber water filter).
- iv) Disappearances of dry skin, eczema and psoriasis have been reported.
- v) Increased hot water pressure and hotter water.
- vi) Softer, silkier hair.
- vii) Cleaner clothes after washing and less powder use.

All this without chemicals or the removal of essential minerals in your drinking water.

ANY PROBLEMS?

Well the Little Plumber products do not work overnight, it can take up to six weeks for you to experience all the benefits listed above, so be patient. Sometimes there's a lot of scale to gradually disperse from your pipes, but once that's all gone you will be enjoying all the benefits of softer water that still retains all the healthy minerals you need like calcium - Good for Bones! Teeth! - Good for growing kids!!

NOTHING ELSE TO DO?

That's it - fit and forget and as long as the Little Plumber is winkingLittle Plumber is working.

GUARANTEES

In line with all other manufacturers of physical field water conditioners we give a full 100-day money back guarantee. Just take LP back to where you got it from with proof of purchase and you will be refunded in full.

THREE YEAR MANUFACTURERS WARRANTY

LPs are made to an exacting ISO 9001 standard, but as human beings are involved things can go wrong, so if it does, return it for a replacement.

The Little Plumber range of water treatment products have been assembled with one overriding aim:

"To provide the very best products at affordable prices."

The Little Plumber units fit into this ethos perfectly, representing excellent value for money without compromise. The LP1 and the larger LP2 incorporate the finest features from the best existing units and combine these into a unique and compact product. They have been skillfully designed to be the best and if you find another unit with a similar specification be prepared to pay about twice the price.

The complete domestic water filtration system

Treat yourself to bottled quality water on tap with one of these superb units, they are easy to install, inexpensive to run, and are delivered within 24 hours.

We are able to combine quality and low cost because of our years of experience in this business and a determination to be the best. Do not tolerate sky high prices for these products, there is no need. All of our units are guaranteed to give years of excellent service, and if you have any problems or questions please call us immediately on 01235 862540.

Little Plumber Electronic Scale Treatment Installation Instructions

Please read these instructions carefully before attempting installation - if you have any problems please call - 01235 862540.

You should have received:

1 x Little Plumber Unit
1 set of Cable Ties
2 x Wall plugs
2 x Screws

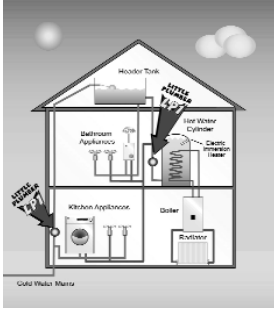

Your new Little Plumber is manufactured to the very high standard of ISO 9001 and will provide you with years of excellent service if it is installed correctly. Please therefore take time to read these installation instructions carefully.

Firstly, you must determine whether your plumbing system is vented or unvented. Vented systems have a cold water storage tank, normally in the loft (you may also have a smaller tank to top up the central heating system but this is entirely separate). Unvented systems have no header tanks and water is heated at mains pressure.

VENTED SYSTEMS

(with cold water storage tank)

You will need to fit one model LP1 on the rising main (cold riser) near the stop-cock. If you have a larger house, eg 5+ bedrooms, you will need to fit an LP2. Remember - the Little Plumber treats water upstream and downstream from the rising main up to the header tank. This means that you can fit the unit anywhere between the two, if you cannot get to the stop-cock. A good place would be in the airing cupboard if you can find the cold riser there. The aerials can be wrapped around any pipe except lead, a lead pipe will not be penetrated by the output signal. If you have a lead pipe then you will need a plumber to insert a section of copper for you, and you can then wrap the aerials around this.

Optional treatment of hot water cylinder: To provide complete protection for your hot water cylinder you should install an additional LP1 on the cold down service between the header tank and the hot water cylinder. This is because the header tank breaks the continuity of the signal generated by the unit installed on the cold riser.

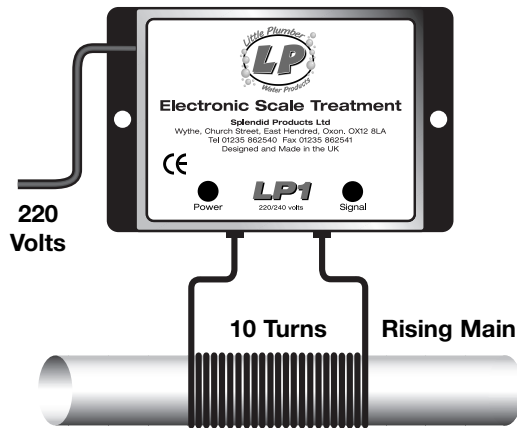

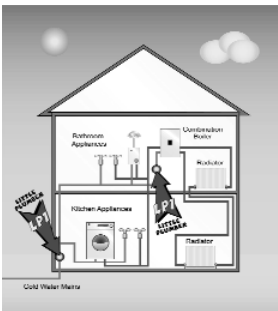

Optional treatment of hot water cylinder:

To provide complete protection for your hot water cylinder you should install an additional LP1 on the cold down service between the header tank and the hot water cylinder. This is because the header tank breaks the continuity of the signal generated by the unit installed on the cold riser.

UNVENTED SYSTEMS

(with no cold water storage tank)

These will generally require only 1 LP unit on the rising main, again a larger property of 5 bedrooms + will require an LP2 here. Combination boilers and heat stores will get dedicated protection if an additional LP1 is fitted on the cold supply, within 1.5 metres of the appliance.

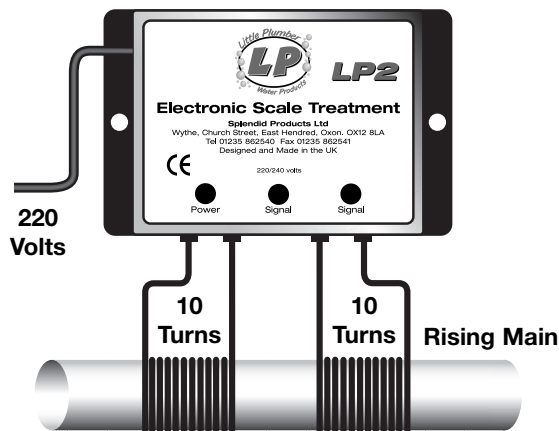

LP1. 1-4 Bedroom Houses

INSTALLATION

Decide exactly where the unit or units are to be installed, ensuring that once the aerial wire is secured to the pipe there is enough spare wire left to plug the ends into the sockets. You will need at least 10 aerial turns for best effect. Simply wind the aerial around the pipe which is being treated and secure both ends with a cable tie, as shown in the diagram.

IT'S SO EASY TO FIT YOUR LP

Any spare aerial left over can be wrapped back over the first windings if you are short of space.

LP2. 5+ Bedroom Houses

Installing an LP2: The LP2 has a much stronger output than the LP1 and has two aerials. Simply repeat the installation procedure as with the LP1 except you will now have 2 aerial loops on your rising main. It is possible to treat two pipes with a single LP2 unit if they are close together. So by installing an LP2 in the airing cupboard, where the cold riser to the header tank and the cold down service to the cylinder often run side by side, household protection can be achieved with one unit.

ELECTRICAL SUPPLY AND POWERING UP YOUR LP UNIT

Once you have installed your Little Plumber it will need some power. If you have a plug nearby, so much the better as your unit is fitted with a 3-pin plug fused to 3 amps. You may run an extension lead to the plug but be sure you know what you are doing here - **IF YOU HAVE ANY DOUBTS CONSULT A QUALIFIED ELECTRICIAN!** If the unit is being professionally installed, the moulded plug can be cut off the power cable, this will enable the unit to be wired directly into a fused spur, or fed through a wall.

The output LEDs on the units only flash when both ends of the aerials are plugged in. If the LP2 is powered up with both aerials already plugged in the output lights will flash simultaneously.

Please, please remember that you should have your Little Plumber on at all times so make sure that you plug it into a socket that isn't to be turned off - if Little Plumber is winking he's working, if he's not he isn't.

SOFT WATER BENEFITS ALL ROUND THE HOUSE! WITH LITTLE PLUMBER ALL READY TO GO

It has been reported by the U.S. government that consumers save a MINIMUM of 48% on their energy costs with the elimination of 3/8 of an inch of limescale build up. So a family of four can save over £400 a year with the removal of costly pipe clogging limescale.
